

IDW Search Results Page — Product & Engineering Spec

IndiaDentalWorld · Patient-Facing Search · Version 1.0 Prepared for: Development Team ·
Date: 29 September 2026

1. Purpose & Business Context

The Search Results Page (SRP) is the primary revenue engine of IndiaDentalWorld. A patient who arrives here has stated intent — they are actively looking for a dentist. The SRP's sole job is to remove every barrier between that intent and a confirmed booking.

Revenue directly on this page:

- **Layer 1** — Booking commission (₹50–₹300 per confirmed appointment). Every “Book Now” tap is a billable event.
- **Layer 3** — Sponsored clinic cards (activated only after 500+ daily organic sessions). Ad revenue per impression and click, ASCI-compliant.

Primary success metric: Booking conversion rate $\geq$ 8% of search sessions. Industry benchmarks: Practo ~6%, Justdial ~4%.

2. URL Structure & SEO Architecture

2.1 URL Pattern

Every search produces a clean, permanent, shareable URL:

```
/search?what=root-canal&where=bengaluru&area=koramangala&dist=5&rating=4&open=true&page=2
```

Parameter	Type	Default	Notes
what	string slug	required	“root-canal”, “orthodontist”, “dentist”
where	string slug	required	“bengaluru”, “mumbai”, “delhi”
area	string slug	optional	Neighbourhood refinement

Parameter	Type	Default	Notes
<code>dist</code>	integer (km)	5	Search radius
<code>rating</code>	float	none	Minimum star rating
<code>open</code>	boolean	false	“Open Now” filter
<code>specialty</code>	string slug	optional	Pre-filled from query
<code>sort</code>	enum	relevance	relevance / distance / rating / price
<code>page</code>	integer	1	Omitted from URL on page 1

Browser back button must restore exact filter state. Any filter change resets `page` to 1.

2.2 Per-Page SEO Tags

Each paginated URL is an independently crawlable document with its own SEO structure.

Title tag (dynamic, server-rendered):

- Page 1: Root Canal Dentists in Bengaluru | IndiaDentalWorld
- Page 2: Root Canal Dentists in Bengaluru – Page 2 | IndiaDentalWorld

Meta description:

- Page 1: Find 247 verified root canal specialists in Bengaluru. Compare prices, ratings & book instantly.
- Page 2+: More verified root canal specialists in Bengaluru – page 2. DCI-verified clinics with real patient reviews.

Canonical tag (prevents duplicate content penalty — each page is canonical to itself):

```
<link rel="canonical" href="/search?what=root-canal&where=bengaluru&page=2">
```

Pagination link tags (tells Google how pages in the series relate):

```

<!-- Page 1 -->
<link rel="next" href="/search?what=root-canal&where=bengaluru&page=2">

<!-- Page 2 -->
<link rel="prev" href="/search?what=root-canal&where=bengaluru">
<link rel="next" href="/search?what=root-canal&where=bengaluru&page=3">

<!-- Page 3 (last) -->
<link rel="prev" href="/search?what=root-canal&where=bengaluru&page=2">

```

2.3 Intro Paragraph (Anti-Thin Content)

Every results page must include a 2–3 sentence auto-generated intro paragraph above the cards. Without this, Google classifies the page as thin content and does not rank it.

Example (auto-composed from query params + city data at render time):

Bengaluru has 247 DCI-verified root canal specialists across neighbourhoods including Koramangala, Indiranagar, and Whitefield. Average RCT cost in Bengaluru ranges from ₹2,200 to ₹8,500 depending on the number of canals and clinic tier.

2.4 JSON-LD Schema

Each results page emits an `ItemList` schema with `MedicalClinic` entries. Position numbers are continuous across pages — position 13 on page 2, not position 1 again.

```

{
  "@context": "https://schema.org",
  "@type": "ItemList",
  "name": "Root Canal Dentists in Bengaluru",
  "numberOfItems": 247,
  "itemListElement": [
    {
      "@type": "ListItem",
      "position": 13,
      "item": {
        "@type": "MedicalClinic",
        "name": "SmileCare Dental Clinic",
        "address": {
          "@type": "PostalAddress",
          "addressLocality": "Koramangala",

```

```

        "addressRegion": "Karnataka"
      },
      "aggregateRating": {
        "@type": "AggregateRating",
        "ratingValue": "4.8",
        "reviewCount": "312"
      }
    }
  ]
}

```

2.5 SEO Compounding Value

16 specialties × 620 cities × average 2 pages = approximately **20,000 indexed search result URLs**, each targeting real patient search intent with unique city + specialty copy. This is IDW's organic SEO moat — replicable only by a competitor with equivalent clinic supply.

This value is only realised if: (a) results pages are server-rendered, not JS-only; (b) each page has a unique title, meta description, canonical tag, and intro paragraph; (c) pagination uses `rel="prev"` / `rel="next"` correctly; (d) JSON-LD uses continuous position numbers across pages.

3. Page Layout — 6 Zones

Zone 1: Sticky Search Bar	(always visible)
Zone 2: Results Header	(count + sort + map toggle + active filter chips)
Zone 3: Filter Panel	(left sidebar desktop / bottom drawer mobile)
Zone 4: Sponsored Cards	(ASCII-labelled, max 2 per page)
Zone 5: Organic Results List	(12 cards per page + Load 8 more)
Zone 6: Pagination Bar	(numbered pages + edge states)

Desktop: Zones 3 and 5 sit side-by-side (260px sidebar + main column). Zone 4 appears above Zone 5.

Mobile: Zone 3 collapses to a horizontal scrollable chip bar above Zone 5. Zone 4 appears inline at position 1 within Zone 5.

4. Zone 1 — Sticky Search Bar

Identical to the homepage SmartSearchBar, pre-filled from the active query.

Behaviour	Detail
Sticky	<code>position: sticky; top: 0</code> — remains visible throughout scroll
Pre-fill	“What” field from <code>?what=</code> , “Where” field from <code>?where=</code>
Live update	Edit either field → 300ms debounce → results update without full page reload
Mobile collapsed	One-line chip: “Root Canal · Bengaluru · × Edit” — tap to expand

Accessibility: `role="search"`, both fields carry `aria-label`, submit button fully keyboard-focusable.

5. Zone 2 — Results Header Bar

Showing 247 clinics for "Root Canal" in Bengaluru Sort by: [Relevance ▼] [MapView]

Element	Behaviour
Result count	Updates live with every filter change. “0 clinics found” triggers the zero-results state
Sort dropdown	Relevance (default) / Distance / Rating / Price: Low to High. Change resets to page 1
Map toggle	Switches to split-pane view. Floating FAB on mobile
Active filter chips	Each applied filter renders as a dismissible chip: “Open Now ×” “≤3 km ×”

6. Zone 3 — Filter Panel

Desktop: Fixed left sidebar, 260px wide. **Mobile:** Full-width bottom drawer, scrollable, with a “Show N results” CTA button pinned at the bottom.

Filter Group	Input Type	Options	Default
Distance	Slider + quick chips	0–20km; presets: <1km / <2km / <5km / <10km / Any	5km
Specialty	Checkbox (multi-select)	All 16 specialties, pre-checked from search query	From query
Rating	Radio (single)	4.5★+ / 4.0★+ / 3.5★+ / Any	Any
Price Range	Dual slider	₹0 – ₹10,000+ with “indicative only” disclaimer	Any
Availability	Checkbox (multi)	Open Now / Available Today / This Week / Walk-ins Accepted	None
Trust	Checkbox (multi)	DCI Verified Only / 50+ Reviews / Photos Available / Online Booking Enabled	None
Facilities	Checkbox (multi)	Digital X-Ray / 3D CBCT / Intraoral Camera / Laser / Wheelchair Accessible / AC	None
Insurance	Toggle	Insurance Accepted	Off

UX rules:

- Filters apply instantly — no “Apply” button required
- “Clear All Filters” link at top of panel
- Filter state persists in URL query params — shareable and back-button safe
- Any filter change resets to page 1

7. Zone 4 — Sponsored Cards

Note: Sponsored cards are planned architecture only. Do not activate until organic daily sessions exceed 500. Activation requires a separate product decision.

Placement: Positions 1 and 5 within the results list. Never consecutive.

ASCI Rule 18 requirements (non-negotiable):

- “Sponsored” label: minimum 12px, colour-contrasted against card background, always visible
 - Cannot be hidden, reduced, or styled to be less prominent than the clinic name
 - Sponsored clinics must be DCI Verified — unverified clinics cannot purchase sponsored slots
 - Sponsored cards must match the searched specialty — no cross-specialty placements
 - Card layout must be visually identical to organic cards except for the Sponsored label
-

8. Zone 5 — Organic Result Cards

8.1 Pagination & Load More

Rule	Value
Cards per page	12
“Load 8 more”	One optional JS reveal within page 1 only — no additional server call
Pagination bar	Numbered: 1 2 3 4 5 ... 21 with Previous / Next
Server rendering	Cards 1-12 must be present in the HTML on initial load — not JS-injected. Critical for SEO

8.2 Card Fields

Each clinic card displays the following in this order:

1. **Clinic photo thumbnail** — 160×120px, WebP, lazy-loaded except cards 1-3 (see Section 9)

2. **Clinic name** — H3, links to clinic profile page
3. **Verification badge** — green “✓ DCI Verified” or amber “Verification Pending”
4. **Location** — area name + distance in km from patient’s location
5. **Star rating** — displayed only when 3 or more reviews exist
6. **Review count** — “(312 reviews)” links to the reviews section on the clinic profile page
7. **Specialties** — maximum 2 shown inline; “+N more” for the remainder
8. **Treatment price** — context-matched to the search query (shows RCT price on a root canal search)
9. **Consultation fee** — always shown below treatment price
10. **Open/closed status** — real-time calculation against IST working hours from clinic profile
11. **Next available slot** — “Today 5:30 PM” / “Tomorrow 10 AM” / “Thu 2 Oct”
12. **Two CTAs** — [View Full Profile] and [Book Appointment →]

8.3 Card States

State	Display Behaviour
Fully verified + active	Full card as specified above
Verification pending	Amber badge; no “Book Now” button; “View Clinic” only
No photos uploaded	CSS-generated branded placeholder: clinic initials on teal gradient. Zero network request
No availability configured	“Contact Clinic” button instead of “Book Now”
Closed today	“Closed Today · Next open: Thu” replaces open status
New listing (<3 reviews)	“New” teal badge instead of star rating
Permanently closed	Must not appear in results — filter at query level, not at render

8.4 Ranking Algorithm (Phase 1 — Algolia)

Signal	Weight	Rationale
Distance from patient	High	95% of dental bookings happen within 5km
DCI Verified status	High	Trust and compliance gate
Profile completeness	Medium	Clinics completing all 7 onboarding screens rank higher
Average rating	Medium	Requires minimum 3 reviews to influence ranking
Open Now status	Medium	Boosts clinics with real-time availability
Subscription tier	Low	Core / Growth / Scale — small but transparent uplift
Recency of reviews	Low	Fresh reviews signal an active practice

Paid sponsorship does not affect organic ranking. Sponsored cards occupy fixed slots separate from the organic order.

9. Image Architecture & Performance

9.1 Image Versions Generated at Clinic Upload

When a clinic uploads a photo during registration, three derivative versions are generated server-side immediately:

Version	Dimensions	Format	Approx. Size	Used In
Card thumbnail	160 × 120px	WebP	~18 KB	Search results cards
Profile hero	800 × 600px	WebP	~120 KB	Clinic profile page
Social share (OG)	1200 × 630px	JPG	~80 KB	Social media previews

The search results page loads only the 18KB thumbnail. The full uploaded image is never fetched by the results page.

9.2 Loading Strategy

Cards 1-3 (above the fold): Preloaded in `<head>` using `<link rel="preload" as="image" href="...">` before rendering starts.

All cards: Native browser lazy loading via `loading="lazy" decoding="async"` attributes on every `<img>`.

All cards: Explicit `width` and `height` attributes declared on every `<img>` to hold space before load, preventing Cumulative Layout Shift (CLS target = 0).

CDN delivery: All thumbnails served from Cloudflare or AWS CloudFront edge nodes, not the origin server. Patients in Bengaluru receive images from a Mumbai or Chennai edge node (~8ms latency vs ~120ms from Delhi origin).

No-photo fallback: CSS-generated placeholder using clinic initials on teal gradient. Zero bytes fetched from the network.

9.3 Page Load Budget

Element	Size	Count	Total
HTML + CSS + JS (gzipped)	~45 KB	1	45 KB
Above-fold thumbnails (preloaded)	~18 KB	3	54 KB
Font subset (Plus Jakarta Sans)	~22 KB	1	22 KB
Inline SVG icons	~3 KB	—	3 KB
Total initial load			~124 KB

Target LCP (Largest Contentful Paint): < 1.8 seconds on 4G. Google's "Good" threshold is 2.5s. Practo's equivalent page loads ~1.8MB. IDW at 124KB is 14× lighter.

10. Map View

Triggered by the "Map View" toggle in Zone 2.

Desktop: Split pane — scrollable results list at 40% width on the left, map at 60% on the right.

Mobile: Full-screen map with a bottom sheet showing the results list. Patient drags up to expand the list.

Element	Behaviour
Clinic pins	One pin per result. Tap opens a mini card popup: clinic name, rating, Book Now
Clustering	Pins cluster at zoom levels where they overlap, showing a count badge
Scroll sync	Scrolling the results list highlights the corresponding pin on the map
Return to list	Persistent “List View” button in the top-left corner of the map

11. Zero Results & Edge States

Zero Results

Never show a dead end. Always offer 3 recovery paths:

1. “Expand to 10 km” — button that widens the radius filter
2. “Show all specialties” — button that clears the specialty filter
3. “Search all of [City]” — button that removes the area refinement

Below the recovery paths: a free-text input — “Describe your concern and we’ll help” — which routes the query through the symptom-to-specialty mapping layer.

Partial Results (fewer than 3 clinics matched)

Show the matched clinics, then below a visual divider: “Also showing clinics slightly farther away” followed by auto-expanded radius results.

12. Mobile-Specific Requirements

Element	Requirement
Filter UI	Horizontal scrollable chip bar below the search bar. “Filters” button opens a full bottom drawer
Card tap area	Full card is tappable. All touch targets minimum 44×44px (WCAG 2.2 AA)
Book Now button	Full width at the bottom of each card — within thumb reach
Map FAB	Fixed floating button at bottom-left
Geolocation	“Use my location” one-tap replaces the Where field
Skeleton loading	Grey shimmer placeholders on all cards during fetch

13. Compliance Requirements

Regulation	Requirement
ASCI Rule 18	“Sponsored” label on all paid cards. Minimum 12px, always visible, never suppressible
NMC Guidelines	No clinic may use “best”, “top”, “No. 1”, or any superlative in listing display copy
DPDP Act 2025	Patient search history not stored without explicit consent. Geolocation requires opt-in
Price transparency	All prices labelled “indicative only” with a ₹ disclaimer adjacent to every price field
DCI verification	Unverified clinics display an amber “Verification Pending” badge and cannot accept bookings
WCAG 2.2 AA	All filters keyboard-operable, all elements screen-reader labelled, contrast ratio ≥ 4.5:1

Regulation	Requirement
GST	Booking commission invoiced at 18% GST. Not displayed to patients

14. Build Sequence

1. Sticky search bar pre-filled from URL params
2. Results header: count + sort dropdown + map toggle + active filter chips
3. Filter panel: sidebar on desktop, bottom drawer on mobile, with URL param sync on every change
4. 12 clinic cards covering all variant states: verified, pending, new, no photo, closed, contact-only
5. Sponsored card slots: UI only at this stage. No ad server integration
6. Live JS filtering and sort operating on mock data
7. Pagination bar: styled, URL-linked, resets on filter or sort change
8. Load 8 more: JS reveal within page 1 only
9. Map toggle view: placeholder map with SVG clinic pins
10. Zero results and partial results edge states
11. Skeleton loader animation on search trigger
12. JSON-LD schema: ItemList + MedicalClinic with continuous position numbers
13. Mobile responsive pass: chip filters, full-width cards, map FAB, thumb-zone CTAs
14. WCAG 2.2 AA audit: keyboard navigation, ARIA labels, colour contrast check throughout
